Question 1:

Over the last couple of weeks our group has completed several tasks for the project. The main focus was on installing and getting familiar with React, which we all accomplished. After that, Collin, Jonatan, and Ty focused on laying out the foundation of the LiveDataLab site, while Seth worked on the backend. We successfully created templates for each page, and Seth made strong progress with implementing Firebase for our backend.

Question 2:

Going forward, we have the following tasks to complete

- Finalize the design of the pages (Home, Projects, Courses, Manage, and Create)
- Add functionality to the buttons that navigate between the menus
- Finish backend implementation
- Add any additional pages or functionality that will make the interface more user-friendly and accessible

Question 3:

The most major challenge we faced was that the LiveDataLab code was never made accessible (at least that we could find) like was promised in the project description. Because of that, it added a lot of additional work of recreating the foundation of the site. Other than that, notable issues were learning React proving difficult, and figuring out how to integrate Firebase with a React app.
